

Artem Sidnev

Backend Software Engineer | Java/Kotlin, Spring Boot, Data-Intensive Systems

a.sidnevar@gmail.com | Telegram | LinkedIn | GitHub | Habr

Summary

Backend software engineer with nearly 3 years of experience building backend systems, data-intensive services, internal platforms, integrations, and automation. Strong in Java/Kotlin backend development, ClickHouse analytical workflows, PostgreSQL, Kafka, Redis, CI/CD improvement, technical documentation, and pragmatic product engineering. Current work at T-Bank focuses on a cashback targeting platform for partner-funded offers.

Core Skills

Languages: Java, Kotlin, Go, Python, TypeScript, SQL

Backend: Spring Boot, FastAPI, REST APIs, PostgreSQL, ClickHouse, Redis, Kafka, SQLAlchemy

Engineering: data-intensive systems, internal platforms, integrations, CI/CD, GitLab CI, Docker, nginx, testing, documentation, incident resolution

Product Domains: cashback targeting, CRM workflows, partner integrations, analytics platforms, Telegram Mini Apps, YClients integrations

Experience

Software Engineer (Backend) | T-Bank

Jan 2025 – Present

- Build backend systems for a cashback targeting platform that processes partner audience data and delivers relevant partner-funded offers to customers.
- Built partner-level targeting by customer spend and income on a flow of about 30M transactions per day across 1.5 years of history; estimated annual business impact reached about \$600K+.
- Contributed to migrating audience-building workflows to an internal ClickHouse-as-a-Service analytical environment, making a critical scenario about 5x faster and moving non-standard processes off the legacy stack.
- Automated partner-region substitution in audience setup, removing 10–15 minutes from a single run and saving up to 40–60 hours of manual work per month.
- Added early validation to critical targeting scenarios, reducing diagnosis time for typical issues by 20–40 minutes.
- Accelerated the main CI pipeline by 5–7 minutes, helped reduce flaky tests, and improved backend reliability through documentation and validation.
- Resolved a major incident in a document workflow service, eliminating reputation risk and helping prevent potential financial loss.
- Built internal automation around GitLab code review, CI refactoring jobs, n8n workflows, and onboarding support.

Commercial Real Estate Analytics Platform | Large Real Estate Agency

Aug 2024 – Aug 2025

- Built backend and automation workflows for a platform combining auction data, CIAN listings, geocoding, a Telegram bot, an admin panel, and a searchable object catalog.
- Enabled realtors to evaluate property economics in about 10 minutes, including sale and rental profitability, key metrics, cash flow, yield, and payback period.
- Enabled district-level market analysis in 7–10 minutes and improved object navigation through an admin panel and structured catalog.

Freelance Backend and Automation Projects

Jun 2023 – Present

- Built Telegram Mini App and backend systems for booking, loyalty, and service-slot workflows using FastAPI, PostgreSQL, Redis, Telegram bot runtime, React/Vite/Tailwind, Docker Compose, and nginx.
- Built Double Kiss booking flows with webhook integration, contact-based registration, YClients booking and loyalty logic, match result confirmation, Elo rating, and bonus debit/credit settlement.
- Built Svobodno, an MVP for booking discounted last-minute service slots with customer, partner, and admin flows.

Open Source

ARC | Local-First Platform for AI Agent Workflows

- Built a local-first environment for safe and reproducible AI-agent work in code projects using a Go CLI runtime, Wails desktop shell, provider adapters, project memory, and execution artifacts.
- Implemented context, memory, and execution-rule management; reduced context load by 48% without lowering response quality.

Education

Canisius University | Bachelor of Computer Science

Additional coursework: Harvard CS50, MIT OpenCourseWare Algorithms, freeCodeCamp Java, freeCodeCamp Spring
